SAS Tokens 287

SAS Tokens

When the SAS System processes a program, a component called the word scanner reads the program, character by character, and groups the characters into words. These words are referred to as tokens. The SAS System recognizes four general types of tokens:

Literal

One or more characters enclosed in single or double quotes. Examples of literals include

'CARY'	"1997"
'Dr. Kemple-Long'	'<entry align="center">'

Name

One or more characters beginning with a letter or an underscore. Later characters can be letters, underscores, and digits.

data	_test	linesleft
f25	univariate	otherwise
year_97	descending	

Number

A numeric value. Number tokens include

- integers. Integers are numbers that do not contain a decimal point or an exponent. Examples of integers include 1, 72, and 5000. SAS date, time, and datetime constants such as '24AUG97'D are integers, as are hexadecimal constants such as 0C4X.
- real (floating-point) numbers. Floating-point numbers contain a decimal point or an exponent. Examples include numbers such as 2.35, 5., 2.3E1, and 5.4E-1.

Special character

Any character that is not a letter, number, or underscore. Examples of special characters include

= + - % & ; ()

The maximum length of any type of token is 200 characters. A token ends when the tokenizer encounters one of the following situations:

- the beginning of a new token
- a blank after a name or number token
- in a literal token, a quote of the same type that started the token. There is an exception. A quotation mark followed by a quotation mark of the same type is interpreted as a single quotation mark that becomes part of the literal token. For example, in `'Mary' 's'`, the fourth quotation mark terminates the literal token. The second and third quotation marks are interpreted as a single character which is included in the literal token.
